

- **Affiliation of creators:** University of Washington.
- **Domain:** social media.
- **Tasks in fairness literature:** fairness evaluation of speech recognition (Tatman, 2017).
- **Data spec:** tabular data.
- **Sample size:**  $\sim 100$  speakers.
- **Year:** 2016.
- **Sensitive features:** gender, geography.
- **Link:** <https://github.com/rctatman/youtubeDialectAccuracy>
- **Further info:** Tatman (2017)

#### A.225 Yow news

- **Description:** this dataset was collected to support research on personalized information integration and retrieval. The data, consisting of implicit and explicit user feedback stored in interaction logs, was gathered in a user study via a special browser accessing a web-based news story filtering system. The task associated with this resource is personalized news recommendation.
- **Affiliation of creators:** Carnegie Mellon University.
- **Domain:** news, information systems.
- **Tasks in fairness literature:** fair ranking (Singh and Joachims, 2018).
- **Data spec:** user-story pairs.
- **Sample size:**  $\sim 10K$  interaction logs.
- **Year:** 2009.
- **Sensitive features:** news provider.
- **Link:** <https://users.soe.ucsc.edu/~yiz/papers/data/YOWStudy/>
- **Further info:** Zhang (2005); <https://users.soe.ucsc.edu/~yiz/piir/>

#### A.226 Zillow Searches

- **Description:** this is a proprietary dataset from Zillow, a famous real estate marketplace. It consists of a random sample of over 13,000 search sessions covering more than 36,000 property listings. Each listing consists of several features, some of which are considered salient by the creators and a sensible target for fair ranking algorithms. Among these are the ownership of the house (Zillow, independent realtor, new construction listed by builders) and the availability of 3D/video tours of the property. This dataset was collected internally to study the problem of fair recommendation and ranking on Zillow data.
- **Affiliation of creators:** Boston University; Zillow Group.
- **Domain:** information systems.
- **Tasks in fairness literature:** fair ranking (Chaudhari et al., 2020).
- **Data spec:** unknown.
- **Sample size:**  $\sim 10K$  search sessions featuring  $\sim 40K$  property listings.
- **Year:** 2020.
- **Sensitive features:** ownership, tour availability.
- **Link:** not available
- **Further info:** Chaudhari et al. (2020)

## Appendix B Adult

Key references include Cohany et al. (1994); Kohavi (1996); UCI Machine Learning Repository (1996); US Dept. of Commerce Bureau of the Census (1995); Ding et al. (2021); McKenna (2019a,b).

## B.1 Datasheet

### B.1.1 Motivation

- **For what purpose was the dataset created?**

The Adult dataset was created as a resource to benchmark the performance of machine learning algorithms. Rather than powering a specific task or application, the dataset was likely chosen as a real-world source of socially relevant data (Kohavi, 1996).

- **Who created the dataset?**

**Barry Becker** extracted this dataset from the 1994 Census database. Ronny Kohavi and Barry Becker donated it to UCI Machine Learning Repository in 1996. At that time, both were working for Silicon Graphics Inc (UCI Machine Learning Repository, 1996)

- **Who funded the creation of the dataset?**

The underlying database is a product of the Current Population Survey (CPS) of March 1994, a joint effort by the US Census Bureau and the US Bureau of Labor Statistics (BLS), funded by the US federal government. The extraction of Adult from the larger database was plausibly part of work remunerated by Silicon Graphics.

### B.1.2 Composition

- **What do the instances that comprise the dataset represent?**

Each instance is a **March 1994 CPS respondent**, represented along demographic and socio-economic dimensions.

- **How many instances are there in total?**

The dataset consists of **48,842 instances**.

- **Does the dataset contain all possible instances or is it a sample (not necessarily random) of instances from a larger set?**

Adult contains individuals from a **sample** of US households, extracted from the 1994 Annual Social and Economic Supplement (ASEC) of the CPS with the following query:

$$(AAGE > 16) \&\& (AGI > 100) \&\& (AFNLWGT > 1) \&\& (HRSWK > 0).$$

This means Adult focuses on a subset of ASEC respondents aged 17 or older, whose income is above \$100, working at least 1 hour per week. While these were conceived as conditions to filter out noisy records (UCI Machine Learning Repository, 1996), they may introduce sampling effects. Moreover, the 1994 CPS data was itself a sample, selected according to Census Bureau best practices, reaching over 70,000 households in nearly 2,000 US counties. The March 1994 CPS sample aimed at obtaining more reliable information on the Hispanic population, and was hence extended to an additional 2,500 eligible housing units.

- **What data does each instance consist of?**

Each instance consists of a combination of nominal, ordinal and continuous attributes, denominated age, workclass, fnlwgt, education, education-num, marital-status, occupation, relationship, race, sex, capital-gain, capital-loss, hours-per-week, native-country. See Table 9 for a detailed explanation of features and their values.

- **Is there a label or target associated with each instance?**

**Yes.** Each person instance comes with a binary label encoding whether their income is above a 50,000 threshold.

- **Is any information missing from individual instances?**

**Yes.** Over 7% of the instances have missing values. This is likely due to issues with data recording and coding or respondents' inability to recall information.

- **Are relationships between individual instances made explicit e.g., users' movie ratings, social network links)?**

**No.** Some instances are related persons from the same household (US Dept. of Commerce Bureau of the Census, 1995) but this information is not reported in the dataset.

- **Are there recommended data splits?**  
**Yes.** The dataset comes with a specified train/test split made using MLC++ GenCV-Files, resulting in a 2/3–1/3 random split (UCI Machine Learning Repository, 1996). The training set consists of 32561 instances, the test set of 16281 instances.
- **Are there any errors, sources of noise, or redundancies in the dataset?**  
**Yes.** Sources of error include definitional difficulties, differences in interpretation of questions, respondents inability or unwillingness to provide correct information, errors made during data collection, data processing or missing value imputation. The tendency in household surveys for respondents to under-report their income was an explicit concern. Finally, noise infusion such as topcoding (saturation to \$99,999) was applied to avoid re-identification of certain individuals (US Dept. of Commerce Bureau of the Census, 1995).
- **Is the dataset self-contained, or does it link to or otherwise rely on external resources?**  
The dataset is **self-contained**.
- **Does the dataset contain data that might be considered confidential?**  
**Yes.** The data is protected by Title 13 of the United States Code, protecting individuals against identification from Census data.<sup>28</sup>
- **Does the dataset contain data that, if viewed directly, might be offensive, insulting, threatening, or might otherwise cause anxiety?**  
**No**, not strictly. Interpreting the question more broadly, however, the envisioned racial and sexual categories may be deemed inadequate.
- **Does the dataset identify any subpopulations (e.g., by age, gender)?**  
**Yes.** The dataset provides information on sex, age and race of respondents. These were self-reported, although self-identification was bounded by envisioned categories. These are (female, male) for sex and (White, Black, American Indian/Aleut Eskimo, Asian or Pacific Islander, Other) for race. Table 6 summarizes the marginal distribution of the Adult dataset across these subpopulations.
- **Is it possible to identify individuals (i.e., one or more natural persons), either directly or indirectly (i.e., in combination with other data) from the dataset?**  
**Unknown.** Important variables for data re-identification, such as birth date or ZIP code, are absent from the Adult dataset. However, instances in this dataset may be linked to the original CPS 1994 data (Ding et al., 2021). Moreover, re-identification studies internal to the Census Bureau pointed to combinations of variables that could potentially be used to re-identify respondents from Census microdata (McKenna, 2019b).
- **Does the dataset contain data that might be considered sensitive in any way?**  
**Yes.** This dataset contains sensitive data, such as sex, race, native country and financial situation of respondents.
- **Any other comments?**  
A precise definition for the variable called `fnlwgt` is unknown. It was used by Census Bureau statisticians to obtain population-level estimates from the CPS sample. For this reason, its use in classification tasks would be unusual.

### B.1.3 Collection process

- **How was the data associated with each instance acquired?**  
Trained interviewers asked questions directly to respondents (US Dept. of Commerce Bureau of the Census, 1995). The data was made available through US Census data products which were used by Barry Becker to extract the Adult dataset.
- **What mechanisms or procedures were used to collect the data?**  
Interviewers conducted the survey either in person at the respondent's home or by phone. They used laptop computers with ad-hoc software to prompt questions and record answers. At the end of each day, interviewers transmitted the collected data via modem to the Bureau headquarters (US Dept. of Commerce Bureau of the Census, 1995).

<sup>28</sup> [https://www.census.gov/about/policies/privacy/data\\_stewardship/title\\_13\\_-\\_protection\\_of\\_confidential\\_information.html](https://www.census.gov/about/policies/privacy/data_stewardship/title_13_-_protection_of_confidential_information.html)

| Demographic Characteristic                    | Values |
|-----------------------------------------------|--------|
| Percentage of male subjects                   | 66.85% |
| Percentage of female subjects                 | 33.15% |
| Percentage of White subjects                  | 85.50% |
| Percentage of Black subjects                  | 9.60%  |
| Percentage of Asian-Pac-Islander subjects     | 3.11%  |
| Percentage of Amer-Indian-Eskimo subjects     | 0.96%  |
| Percentage of people belonging to other races | 0.83%  |
| Percentage of people between 16-19 years old  | 5.14%  |
| Percentage of people between 20-29 years old  | 24.58% |
| Percentage of people between 30-39 years old  | 26.47% |
| Percentage of people between 40-49 years old  | 21.95% |
| Percentage of people between 50-59 years old  | 13.55% |
| Percentage of people between 60-69 years old  | 6.25%  |
| Percentage of people between 70-79 years old  | 1.67%  |
| Percentage of people between 80-89 years old  | 0.27%  |
| Percentage of people between 90-99 years old  | 0.11%  |

Table 6: Demographic Characteristics of the Adult dataset.

- **If the dataset is a sample from a larger set, what was the sampling strategy?**

A probabilistic sample was selected according to US Census Bureau best practice, with a multi-stage stratified design. The US territory was divided into strata, from which one county (or group of counties) was selected. From each selected county a sample of addresses was later obtained and added to the sample (US Dept. of Commerce Bureau of the Census, 1978). Barry Becker extracted a “set of reasonably clean records” using the following conditions:

$$(AAGE > 16) \&\& (AGI > 100) \&\& (AFNLWGT > 1) \&\& (HRSWK > 0).$$

- **Who was involved in the data collection process and how were they compensated?**

Interviewers trained by the US Census Bureau were involved in the data collection process. Data extraction was later performed by Barry Becker while affiliated with Silicon Graphics. Their compensation is unknown.

- **Over what timeframe was the data collected?**

Respondents were interviewed in March 1994, while the Adult dataset was donated to UCI ML Repository in May 1996.

- **Were any ethical review processes conducted?**

The Microdata Review Panel likely reviewed this data for compliance with Title 13 (McKenna, 2019b) and authorized its publication.

- **Was the data collected from the individuals in question directly, or obtain it via third parties or other sources?**

**Directly.** US Census Bureau interviewers collected the data through interviews, conducted in person or over the phone. Danny Kohavi and Barry Becker later processed this data, obtaining it from the Census Bureau website.

- **Were the individuals in question notified about the data collection?**

**Yes.** Individuals knew they were part of a sample chosen by the Census Bureau chosen for statistical analysis. They were not notified about their data being included in the Adult dataset.

- **Did the individuals in question consent to the collection and use of their data?**  
**Yes.** For the CPS, participation is voluntary. A recent version of the information provided to respondents before interviews is available on the US Census Website.<sup>29</sup>
- **If consent was obtained, were the consenting individuals provided with a mechanism to revoke their consent in the future or for certain uses?**  
**Unknown.**
- **Has an analysis of the potential impact of the dataset and its use on data subjects been conducted?**  
**Yes.** Re-identification studies have been conducted both internally (McKenna, 2019b) and externally (Rocher et al., 2019) on Census Bureau data. McKenna (2019b) mention finding combinations of variables on Census files that can lead to successful re-identification, which were subsequently removed or protected with noise injection. Rocher et al. (2019) demonstrate on the Adult dataset that the likelihood of a specific individual to have been correctly re-identified can be estimated with high accuracy. We are unaware of studies about the potential impact of successful re-identification on respondents.

#### B.1.4 Preprocessing/cleaning/labelling

- **Was any preprocessing/cleaning/labeling of the data done?**  
**Yes.** Preprocessing operations by the Census Bureau include missing value imputation and topcoding. Furthermore, Barry Becker and Ron Kohavi binarized the income variable ( $> \$50K$ ) and discarded several CPS respondents who are not included in the Adult dataset.
- **Was the “raw” data saved in addition to the preprocessed/cleaned/labeled data?**  
**Unknown.**
- **Is the software used to preprocess/clean/label the instances available?**  
**Likely no.** It seems unlikely for the code to be available 25 years after its last known use.

#### B.1.5 Uses

- **For what tasks has the dataset been used?**  
 This dataset probably owes its status in the ML community to an early position of publicly-available and interesting resource based on real-world data. For this reason, rather than powering specific applications, Adult is used as a benchmark for classifiers in many fields of machine learning. Due to its encoding of sensitive attributes, it has also become the most used dataset in the fair ML literature.
- **Is there a repository that links to any or all papers or systems that use the dataset?**  
**Yes.** A selection of early works (pre-2005) using this dataset can be found in UCI Machine Learning Repository (1996). A more recent list is available under the beta version of the UCI ML Repository.<sup>30</sup> See Appendix A.7 for a (non-exhaustive) list of algorithmic fairness works using this resource.
- **What (other) tasks could the dataset be used for?**  
 The Adult dataset is used in tasks where data of social significance is deemed important, for example privacy-preserving ML.
- **Is there anything about the composition of the dataset or the way it was collected and preprocessed/cleaned/labeled that might impact future uses?**  
**Yes.** The threshold used to quantize income for a binary classification task is very high (\$50K). As a result a trivial rejector achieves very large accuracy on the black subpopulation (93%). For the same reason, models are often more accurate for the female subpopulation than for the male one (Ding et al., 2021). Some numerical results on Adult may be an artifact of this threshold choice.

<sup>29</sup> [https://www2.census.gov/programs-surveys/cps/advance\\_letter.pdf](https://www2.census.gov/programs-surveys/cps/advance_letter.pdf)

<sup>30</sup> <https://archive-beta.ics.uci.edu/ml/datasets/2>

- **Are there tasks for which the dataset should not be used?**  
Based on the previous answer, we caution against drawing overarching conclusions based on experimental results obtained on this dataset alone.

#### B.1.6 Distribution

- **Is the dataset distributed to third parties outside of the entity on behalf of which the dataset was created?**  
**Yes.** The dataset is publicly available (UCI Machine Learning Repository, 1996).
- **How is the dataset distributed?**  
The dataset is available as a **csv file**.
- **When was the dataset distributed?**  
The dataset was released on the UCI ML Repository in **May 1996**.
- **Is the dataset distributed under a copyright or other intellectual property (IP) license, and/or under applicable terms of use (ToU)?**  
**Yes.** The UCI ML repository has a citation policy. Terms of Use concerning the privacy of CPS respondents are likely to apply.
- **Have any third parties imposed IP-based or other restrictions on the data associated with the instances?**  
**Likely no.** We are unaware of any IP-based restrictions.
- **Do any export controls or other regulatory restrictions apply to the dataset or to individual instances?**  
**Likely no.**

#### B.1.7 Maintenance

- **Who is supporting/hosting/maintaining the dataset?**  
The dataset is hosted and maintained by the **UCI Machine Learning Repository** (UCI Machine Learning Repository, 1996).
- **How can the owner/curator/manager of the dataset be contacted?**  
Comments and inquiries may be directed at [ml-repository@ics.uci.edu](mailto:ml-repository@ics.uci.edu). Ronny Kohavi is the primary contact for this specific resource, available at [ronnyk@live.com](mailto:ronnyk@live.com).
- **Is there an erratum?**  
**Likely no.** We are unaware of any erratum.
- **Will the dataset be updated?**  
A superset of the dataset without quantization of the target income variable is available (Ding et al., 2021).
- **If the dataset relates to people, are there applicable limits on the retention of the data associated with the instances?**  
**Unknown.**
- **Will older versions of the dataset continue to be supported/hosted/maintained?**  
Unless otherwise indicated, the Adult dataset will remain hosted on the UCI ML Repository in its current version.
- **If others want to extend/augment/build on/contribute to the dataset, is there a mechanism for them to do so?**  
**Unknown.**

## B.2 Data Nutrition Label

### B.2.1 Metadata

| METADATA                       |                                                                                                                                                                                           |
